Copernicus Climate Change Service - 311a Lot 2 Defining a Common Data Model

David I. Berry National Oceanography Centre, UK 28th June 2017

Summary

This document describes background information and a summary of initial steps taken towards defining a common data model for the representation of in situ observations as part of the C3S 311a activity.

An overview of the preferred data model from Lot 2 is given and participants on the call are invited to:

- Review the background information and proposed data model presented in this document
- Endorse the proposed data model or propose an alternative model for use within C3S 311a.

1 Introduction

The Copernicus Climate Change Service (C3S), through its "Collection and Processing of In Situ Observations (C3S 311a)" tender, seeks to harmonise both data formats and metadata (discovery and observational) conventions. The first step of this process, as noted within the invitation to tender, is the development or adoption of a common data model for the data and metadata. Within this document, when complete, we will describe the common data model developed within Lot(s) 1 - 4 of the C3S 311a tender in consultation with ECMWF. The themes for the Lots 1 - 4 are:

- Lot 1 Coordination of data rescue activities
- Lot 2 Access to observations from global climate data archives
- Lot 3 Access to observations from baseline and reference networks
- Lot 4 Climate monitoring products for Europe based on in situ observations.

Lot 1 (C3S DRS) are building a new data portal, led by the WMO I-DARE portal lead from KNMI, that will be melded together with a much enhanced EU FP 7 ERA-CLIM 2 data registry, led by that project's Portuguese lead, plus new and enhanced data tools and techniques led by the University of Bern group. Data rescue accounts for only 10 - 15% of the Lot 1 budget, and is focused on three regions in the Southern Hemisphere in and around Argentina, South Africa and in the New Zealand to Drake Passage sector, but will link closely to the larger data rescue efforts of ACRE, IEDRO, ICA&D and similar. As with Lot 2, Lot 1 will deal with the full range of historical terrestrial and marine surface weather observations plus upper air data, serving the various international repositories these data are held in, plus having the capacity to deal with their metadata (including a compendium of all data forms/templates these data are recorded on), scanned images of hard copy data, and weather and analogue (pluviograms, thermograms, barograms etc) charts etc.

Within Lot 2, observations and metadata from land stations and marine platforms will be harmonised into a common data model and a web based service developed to serve the data through the C3S Climate Data Store (CDS). The observations include instantaneous / point observations, such as those from SYNOP weather reports, as well as daily and monthly summaries (CLIMAT DAILY and CLIMAT). A single report may contain observations of multiple parameters, e.g. air temperature, humidity, wind speed etc. The stations range from stationary land stations to mobile merchant ships, drifting buoys and other marine platforms.

Lot 3 are creating a harmonized observational dataset of measurements from the Global Base-line and Reference radiosounding networks. Within the first year observations are restricted to temperature and humidity measurements, in future years this will be expanded to include other essential climate variables (surface temperature, wind, ozone, trace gases, GPS IWV). Observations from the GRUAN and GUAN networks will be the main focus, but with potential extension to the broader RAOB program. Annual updates will be provided. Integrated physical and statistical corrections will be used to improve the quality of the baseline observations using the data from the reference networks. Lot 3 intend to be fully compliant with ODB version 2 (ODB2), noting that some changes will be necessary to ODB2 to report the full range of information required. Discovery metadata are planned to be compliant with ISO 19115 and observational metadata reported using the CF conventions. Compliance with the WIGOS metadata standard is also expected.

Lot 4 will build on and extend the European Climate Assessment and Dataset (ECA&D) project and E-OBS daily dataset for Europe. The gridded E-OBS dataset was initially developed as part of the ENSEMBLES project for statistical comparisons with Regional Climate Model output

¹From the ITT: A common data model is different from a file format, which defines how information is encoded in a file. The purpose of a data model is to provide a well-defined data structure that can be used to represent data records from a variety of sources, in such a way that the information contained in those records can be unambiguously accessed using a common set of tools. Development of a common data model for observations involves specification of data attributes and their symbolic names, including, for example, identifiers for different instruments, observed parameters, geolocation and timing, etc. A governance structure is required to manage such specifications, ensure consistency with standards where they exist, and to ensure a controlled evolution of the data model.

(Haylock et al., 2008). More recently European research projects EURO4M, UERRA, EUPO-RIAS, EUSTACE, and CLIPc led to further improvements and applications, and ECA&D/E-OBS has now become reference datasets for a larger user community, also outside climate research. Funding by EUMETNET and KNMI supported the developments of additional functionality, and the close collaboration with EUMETNET members has led to strongly improved ECA&D station coverage over Europe in recent years. Within C3S_311a lot 4, the ECA&D and E-OBS will be transformed into an operational system for the Copernicus Climate Change Service (C3S), delivering regularly updated gridded products based on European in-situ data for many Essential Climate Variables (ECVs). The underlying station data that include surface air temperature, precipitation, humidity, wind speed and direction, will be made available as well, pending permission by the owners of these data. To serve climate change monitoring and climate impact assessments a large number of user-oriented climate indices will be provided, both as time series at station sites and as gridded products. No preference has been specified for the data models to be used.

Section 2 of this report provides background information on joint activities between Lots 2 and 3 so far, the ECMWF Observations DataBase (ODB) data model and relevant WMO data models. Section 3 gives an overview of the preferred data model from Lot 2 and proposes a list of elements for the observations table. Auxiliary tables are also proposed in Section 3 but left empty for future discussion once the principles of the type of data model have been agreed across lots. Section 4 proposes a governance mechanism for the common data model across lots and next steps required.

2 Background and existing standards

2.1 ODB and tenders for Lots 2 and 3

Both Lots 2 and 3 have proposed using data models based on the data model developed by ECMWF as part of the Observations DataBase (ODB) software. Within the ODB type data model each observation of a single parameter is stored as a separate record, with a single report spanning multiple records. Within each record the station / report information is repeated. A simplified example is shown in Table 1.

Table 1: Simplified example of records in ODB type data model, with observations from reports 1 and 2 spanning multiple records. For simplicity, the z coordinate has been omitted but profile data would be represented with each layer / height as a separate record

		head	er informatio	n	observation	informat	ion

			18:00+0.0	40.2)	pressure		

End of table

The implementation of the ODB model at ECMWF, that proposed in Lots 2 and 3 all have differing requirements. For example, the existing observations table columns defined within ODB² contain many parameters that are of little relevance to the In Situ observations but are relevant to the assimilation of data from many different sources into the numerical models. Conversely, there are many parameters included in the data from Lots 2 and 3 that are required to correctly

²http://apps.ecmwf.int/odbgov/column/

interpret the observations but that are not included in ODB.

In order to facilitate the development of the data model there have been two initial teleconferences between Lots 2 and 3 discussing the CDM and collating information on the parameters required . Each parameter and report type has its own unique set of fields and metadata fields. For example, surface air temperature observations are typically made in a screen or shelter that can influence the quality of the measurements. As a result, it is desirable to include information on the screen type, material and dimensions alongside the observation. For upper air temperature observations this metadata information is not relevant but other parameters will be required, such as the type of balloons used, instrument type and burstpoint.

In order to represent the wide variety of metadata required across (and within) Lots three different solutions are possible:

- The observations table is expanded to include all possible metadata fields, with new columns added when a new data / report type is included.
- Each report (and possibly parameter) type has a separate observations table, with a minimum set of common parameters defined across the different tables.
- The observations table is defined to include the minimum set of information required for each observation and the metadata is then linked via a series of Entity-Attribute-Value (EAV) based tables (e.g. see Table 2).

Within this document we are proposing to use solution (3), defining a minimum set of parameters to be included in the observations table and linking to the metadata in auxiliary tables. Solution (1) has been discounted as being impractical from an implementation perspective and from the perspective of adding new data types at a future date. Option (2) has not been discounted but will result in a series of data models being defined rather than a single unified data model.

Example EAV table here ...

2.2 BUFR and WIGOS Metadata Standard

Prior to defining the data model it is useful to refer to both the WMO Binary Universal Form for the Representation of meteorological data (BUFR) (WMO, 2015a) and the WMO Integrated Observing System Metadata Standard (WMDS) (WMO, 2015b).

The BUFR format is a flexible and efficient table driven format for reporting weather observations on the WMO Global Telecommunications System (GTS) in binary. The tables defined as part of the BUFR format include many of the parameters that will be included in the CDM. For example, Common code table C6 (WMO 2015a) includes all the measurement units reportable in BUFR (and other WMO codes). Similarly, code tables are defined for reporting instrument types and methods, station types etc. Where possible, these code tables should be referenced and used in preference to defining new code tables.

In recognition of the increasing importance of observational metadata the WMDS is currently under development and undergoing a phased implementation (WMO, 2015b). The WMDS forms an extension of the ISO19115 metadata standard, with additional mandatory elements describing both the station level and discovery metadata as well as specific information on the instrumentation used and processing steps. As part of the process simplified versions of BUFR and other tables have been included in the standard. As with BUFR these tables should be referenced, where appropriate, in preference to defining new code tables. Additionally, for compatibility with WIGOS the CDM should contain all mandatory elements of the WMDS.

3 Common Data Model

As noted above, we are proposing a data model based on the ODB type data model, but with the metadata linked through a series of auxiliary / configuration tables. A schematic of this

is shown in Figure 1. The observations table is described fully below (Table 3) and contains the geospatial (xyz) and temporal (t) locations of both the station making the report and the observed parameter, unique identifying information for the station, source data (i.e. dataset) information, observed values and data licencing / usage rights. In Table 3 below, where we list the proposed elements for the observations table, we also identify where there is overlap with the elements required by the WMDS. It should be noted that not all elements from the WMDS will appear in the observations table but will be included in the auxiliary tables.

Simplified CDM schematic here

To enable flexibility and accommodate the diverse data types and metadata the additional tables are proposed to be EAV based (see Table 2 above for example). This also gives the flexibility of adding a new metadata field by simply adding a new row rather than column. Within the following tables the following syntax has been used to indicate the data type for the different elements:

• numeric: Any numeric value (integer or floating point).

• int: An integer value.

• varchar: A variable length character string.

• timestamp: A timestamp, e.g. "2017-07-01 00:00:0.0+00".

• []: An array of the indicated type.

• (fk) The indicated value is also a foreign key linking to another table.

3.1 Observations table

Preamble text ...

Table 2: observations_table

element_number	element_name	kind	external_table	description
-	report_id	bigint (pk)		Unique ID for report (unique ID given by combination of RecordID and ObservationID)
2	region	int (fk)	region	Region (WMO region / Ocean basin)
က	sub_region	int (fk)	sub_region	Country / regional sea
4	application_area	int[] (fk)	application_area	WMO application area(s)
2	observing_programme	int[] (fk)	observing_programme	Observing programme, e.g. VOS
9	report_type	int (fk)	report_type	e.g. SYNOP, TEMP, CLIMAT, etc
7	station_name	varchar		e.g. GRUAN station name, ship
				name, site name etc
æ	station_type	int (fk)	station_type	Type of station, e.g. land station, sea station etc
6	platform_type	int (fk)	platform_type	Structure upon which sensor is mounted,
				e.g. ship, drifting buoy, tower etc
10	platform_sub_type	int (fk)	platform_sub_type	Sub-type for platform, e.g. 3m discuss buoy
=	primary_station_id	varchar		Unique (WMO) station identifier, e.g. WIGOS ID
12	primary_station_id_scheme	int (fk)	id_scheme	Scheme used for unique station ID
13	secondary_station_id	varchar		Alternate (local) ID for station, e.g. Network ID
14	secondary_station_id_scheme	neme int (fk)	id_scheme	Alternate ID Scheme, e.g. Network ID
15	station_location_longitude	numeric		Longitude of station, -180.0 to 180.0 (or
				other as defined by station_crs)
16	station_location_latitude	numeric		Latitude of station, -90 to 90 (or other
				as defined by station_crs)
17	station_location_accuracy	numeric		Accuracy to which station location
				recorded (radius in km)
18	station_location_method	int(fk)	location_method	Method by which location determined
19	station_location_quality	int (fk)	location_quality	Quality flag for station location
20	station_crs	int (fk)	Crs	Coordinate reference scheme for station location
21	station_speed	numeric		Station speed over ground if mobile (m/s)
22	station_course	numeric		Station course over ground if mobile (degree true)
23	station_heading	numeric		Station heading if mobile
24	surface_type	int (fk)	surface_type	e.g. rolling hills

Table 11: communication_method

value	description
0	Cellular (unspecified)
1	Meteosat DCP
2	Iridium (unspecified)
3	GOES DCP
4	VSAT (unspecified)
5	Landline telephone
6	Radio modem
7	E-mail (unspecified)
8	Voice (ship). The observation is sent to a NMS
0	through the telephone network. The communi-
	cation may use Inmarsat, Iridium, Vsat, VHF
0	
9	Email (ship). The observation is sent to a NMS
	through an email. The WMO message is attached to this email. The satellite communication
-10	provider may be Inmarsat, Iridium, Vsat
10	Web (ship). The observation is sent
	through the Web (example: TurboWeb).
	The satellite communication provider
	may be Inmarsat, Iridium, Vsat
11	Inmarsat-C (FM13, SAC41). Standard procedure
	used to report observations (FM13 messages)
	from conventional VOS for many years. Collect
	call system: the NMS which receives the
	observations pays the communication costs
12	Inmarsat-C (FM13, other SAC). FM13 messages
	are sent to a dedicated SAC (other than
	SAC41) established at one, or more LES.
	In general, communications are paid by
	the country who recruited the ship
13	Inmarsat-C (EUHC). Text messages containing
	compressed data (E-SURFMAR format) are
	sent ashore through Inmarsat-C to a dedicated
	SAC and LES. Communications are paid
	by the country who recruited the ship
14	Inmarsat-C (SEAS). SEAS binary mes-
	sages sent through Inmarsat-C Data Mode
	to a dedicated SAC and LES. Commu-
	nications are paid by NOAA/NWS
15	Automated Identification System (di-
	rect or through satellite)
16	Argos system
17	Cellular (Dial-up). Dial-up communication using
-10	terrestrial wireless networks (GSM, GPRS)
18	Cellular (SMS). SMS sent through terrestrial
-10	wireless networks (GSM, GPRS)
19	Globalstar communication system
20	GMS (DCP). Data Collecting Platform of
	Geostationary Meteorological Satellites
21	Iridium (SBD). Short Burst Data service
	of Iridium communication system
22	Iridium (Email). Email sent through
-	Iridium (e.g. Easymail)
23	Iridium (Dial-up). Dial-up commu-
	nication using Iridium

value	parameter_group domain	pdomain	sub_domain	abbreviation	name	nnits	description
53	wind	atmospheric	surface; upper-air	W	wind_speed	m s-1	Speed is the magnitude of velocity. Wind is defined as a two-dimensional (horizontal) air velocity vector, with no vertical component. (Vertical motion in the atmosphere has the standard name upward_air_velocity.) The wind speed is the magnitude of the wind velocity.
30	wind	atmospheric	surface	w-gust	wind_speed_of_gusth s-1	usth s-1	Speed is the magnitude of velocity. Wind is defined as a two-dimensional (horizontal) air velocity vector, with no vertical component. (Vertical motion in the atmosphere has the standard name upward_air_velocity.) The wind speed is the magnitude of the wind velocity. A gust is a sudden brief period of high wind speed. In an observed timeseries of wind speed, the gust wind speed can be indicated by a cell_methods of maximum for the time-interval. In an atmospheric model which has a parametrised calculation of gustiness, the gust wind speed may be separately diagnosed from the wind speed.

30	Ship	VC	Vehicle carriers
31	Ship	YA	Yacht / Pleasure Craft
32	Ship	BA	Barges, including crane barges and tank barges.
33	Ship	BC	Bulk Carriers, including Ore/Bulk/Oil
	·		(OBO) carriers and Ore/Oil carriers.
34	Ship	CA	Cable ships.
35	Ship	CG	Coastguard cutters, patrol ships and launches.
36	Ship	CS	Container ships, including open and closed
	•		container ships and refrigerated container ships.
37	Ship	DR	Dredgers including bucket, hopper,
	•		grab and suction dredgers.
38	Ship	FE	Passenger ferries (carrying passengers only).
39	Ship	FP	Floating Production and Storage Units.
40	Ship	FV	Fishing Vessels including purse seiners,
. •	ор		long liners etc., but excluding trawlers.
41	Ship	GC	General Cargo ships with one or more holds.
42	Ship	GT	Liquefied gas carriers/tankers includ-
	Cilip	G I	ing LNG and LPG carriers.
43	Ship	IC	Icebreaking vessels (dedicated ves-
40	Omp	10	sel). If the vessel fits in another cat-
			egory and is ice strengthened
44	Ship	LC	Livestock Carrier (dedicated ship for
77	Onip	LO	the carriage of livestock).
45	Ship	LT	Liquid tankers including oil product tankers,
40	Onip	Li	chemical tankers and crude oil tankers
			(including VLCC's and ULCC's).
46	Ship	LV	Light vessels.
47	Ship	MI	Mobile installations, including mobile offshore
47	Onlp	IVII	drill ships, jack-up rigs, semi-submersibles.
48	Ship	MS	Military ships.
49	Ship	OW	Ocean Weather Ships (dedicated weather ship).
50	Ship	PI	Pipe Layers.
		PS	· •
51	Ship		Passenger ships and Cruise liners.
52	Ship	RF	Ro Ro ferries (carrying passen-
	Oleite	DD.	gers and laden vehicles).
53	Ship	RR	Ro Ro cargo ships for carriage of road
			and/or rail vehicles and cargo, in-
	Olata	DO	cluding containerised cargo.
54	Ship	RS	Refrigerated cargo ships including banana ships.
55	Ship	RV	Research Vessels, including oceanographic,
			meteorological and hydrographic research
	Ole	0.4	ships and seismographic research ships.
56	Ship	SA	Large sailing vessels, including
	01.	0)/	sail training vessels.
57	Ship	SV	Support vessels including offshore support
			vessels, offshore supply vessels, stand-by
			vessels, pipe carriers, anchor handling
			vessels, buoy tenders (including coastguard
			vessels engaged solely on buoy tending
			duties), diving support vessels, etc.
58	Ship	TR	Trawler fishing vessels.

Table 42: spatial_representativeness

value	description
0	Nil reason - None of the codes in the table is
	applicable in the context of the observed quantity
	or unknown, or not available information.
1	Microscale - An area or volume less than 100
	m horizontal extent (for example, evaporation)
2	Toposcale, local scale - An area or volume
	of 100 m to 3 km horizontal extent (for
	example, air pollution, tornadoes)
3	Mesoscale - An area or volume of 3 km
	to 100 km horizontal extent (for example,
	thunderstorms, sea and mountain breezes)
4	Large scale- An area or volume of 100 km
	to 3000 km horizontal extent (for example,
	fronts, various cyclones, cloud clusters)
5	Planetary scale - An area or volume of
	more than 3000 km horizontal extent (for
	example, long upper tropospheric waves)
6	Drainage area - An area (also known
	as catchment) having a common outlet
	for its surface runoff, in km2
